

Drafting Practical Assessment

Scenario #2 Handout

This is a timed scenario based on a large remote fire (lakeside outbuilding, 1-2 engine plane down on Utah Lake Dike Road, etc.) that requires a drafted water source and a remote master stream. The scenario will begin when fire fighters begin to don PPE for the scenario and will end when the scenario objective is met - a single 5" remote Master Stream is established with a drafted water source and attack water reaches the designated area (cone or prop). Attack crews require full PPE. Good luck!

Proctors will be stationed at:

- 1 – The staging area for the scenario briefing.
- 2 – At the drafting site (Draft Hose supplied for non-equipped apparatus)

You may ask for assistance from the proctors, but the time will not be stopped.

After the scenario has ended, please return draft hoses to their starting positions and rehab as necessary – flushing your water pump with a domestic water supply and the flushing of tank water 1-2 times if co-mingled in the tank. A timed breakdown for the event will be provided to the Captain as well as short debrief for crew questions if desired.

Any questions? Good luck!
